Learning Objectives

- Upon completion, participant will be able to articulate the purpose of emerging technologies programs and their approach to market transformation.
- Upon completion, participant will be able to describe the foci of federal-, regional- and state-level emerging technologies programs.
- Upon completion, participant will be able to identify and recommend technologies and projects suitable for emerging technologies programs.
- Upon completion, participant will be able to utilize the proper channels to participate in the emerging technologies programs.

What is Market Transformation?

“The strategic process of intervening in the market to create lasting change by removing identified barriers and/or exploiting opportunities to accelerate the adoption of all cost-effective energy efficiency as a matter of standard practice.” – NEEA

A Tale of Two Program Types

Direct Acquisition	Market Transformation
“ <u>Buying</u> kWh savings”	“ <u>Influencing</u> market change that results in kWh savings”
Focus on individual end-users; single transactions	Focus on permanent changes to whole markets
Incentives targeted to consumers to buy down cost	Incentives targeted to change supply chain behavior
Assumed direct linkage between actions (incentives) and savings	Actions designed to reduce overall market costs and increase savings including marketing, education and outreach by diffusion into the whole market.
Annual or bi-annual savings targets	Long-term (5 to 10 year) market adoption goals (e.g. 85%)

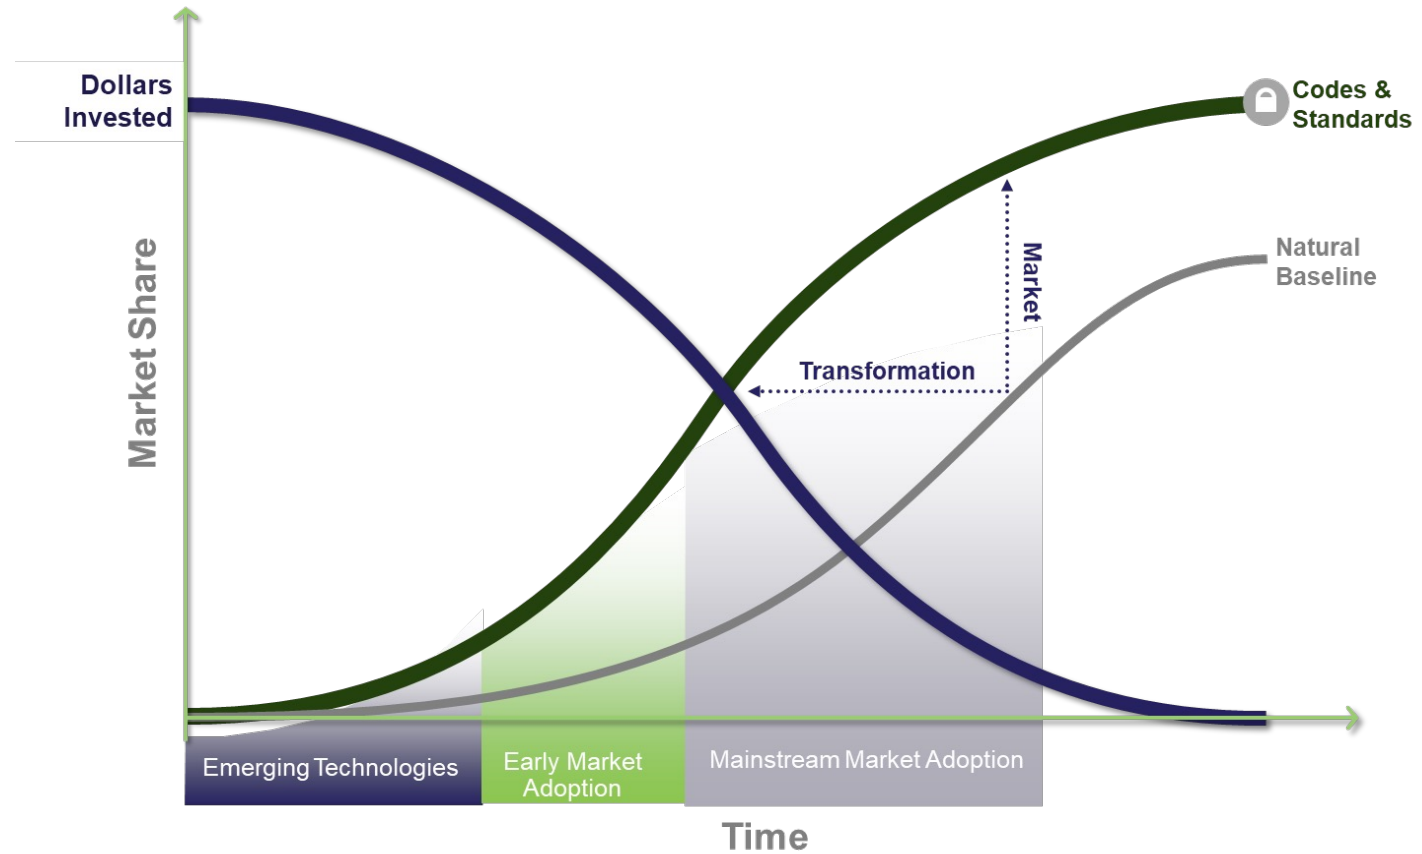

High-hanging fruit =
better targeting,
right-sized approach

Smaller, distributed
fruit = aggregated,
mass collection

OVERVIEW

Agenda

Three Different Market Transformation Programs

- CalNEXT (State Level)
- NEEA (Regional Level)
- DOE (National Level)
- Q&A

CalNEXT: California Statewide Electric Emerging Technologies Program

Market transformation effort at the state level

What is CaINEXT?

- A path for emerging technologies to be supported by utilities for mass adoption
- No more “pilot to death” or “forever demonstrations”
- Lighting experts and technical advisors to make sure we are not just chasing efficacies and ignoring everything else

Program Objectives

- **Communicate** program priorities to stakeholder community.
- **Scan, Prioritize, Evaluate** commercially available, emerging, or underutilized technologies and their applications to support increased adoption in the IOU EE portfolios.
- **Broadcast** results to inform stakeholders, support technology transfer, and advance industry understanding to support large-scale commercial adoption.
- **Advance** California's decarbonization, equity, and grid priorities by incorporating them into research priorities.
- **Execute** emerging technology research projects that support the IOU energy efficiency portfolios.

Program Objectives

- **Communicate** program priorities to stakeholder community.
- **Scan, Prioritize, Evaluate** commercially available, emerging, or underutilized technologies and their applications to support increased adoption in the IOU EE portfolios.
- **Broadcast** results to inform stakeholders, support technology transfer, and advance industry understanding to support large-scale commercial adoption.

What are the TPMs?

High-Level Framework
Explains the CaINEXT program priorities with annual updates, sorted into six technology categories

Communications Tool
Defines what research topics CaINEXT emphasizes on

Screening Metric
Project scoring based on alignment with TPMs

TPM Components

Technology Category	<i>i.e. Lighting</i>
Technology Family	<i>Functional grouping of program roles, opportunities, and barriers</i>
Technology Subgroup	<i>Example technologies (non-exhaustive)</i>
Definition	<i>Narrative to provide additional clarity on the Technology Family scope</i>
Opportunities	<i>Description of the potential impacts and research areas</i>
Barriers	<i>Description of key barriers and potential research areas</i>
CaINEXT Priority	<i>Degree of emphasis on the Technology Family</i>
CaINEXT Role	<i>Level of support (funding) for the Technology Family</i>

Example Technology Family

Technology Category	Lighting
Technology Family	Connectivity, Controls, and Integration
Technology Subgroup	<ul style="list-style-type: none"> • Integrated lighting control systems • Advanced daylighting controls • Lighting energy management systems • BMS Integration
Definition	Sensors, communication systems, and control algorithms that reduce energy consumption in lighting and other building systems, provide data for other purposes, or enhance occupant comfort and wellness.
CaINEXT Priority	High
CaINEXT Role	Lead

Opportunities and barriers narratives and other Technology Families: <https://calnext.com/resources/lighting/>

Lighting Technology Priority Map (TPM)

What is the CaINEXT Process?

Submit an Idea

Submit a Project

Idea Submission

CaINEXT

The screenshot shows a web form titled "CaINEXT Idea Submission Form" with the following sections:

- 9. Please provide a brief description of your proposed idea.**
Include the problem you are trying to solve, limit description to 500 words
[Text input field]
- 10. Which technology area does this project mostly align with?**
Please select one option from the drop down
[Dropdown menu]
- 11. Is the technology / solution available in the market today? Which best describes the current state of the idea? Choose all that apply.**
 - It is commercially available
 - It has finished conducting field demonstration(s)
 - It has finished conducting lab demonstration(s)
 - It has completed prototype development
 - Not sure
- 12. Please describe the target market sector applicable to this idea.**
For example, Residential, Multifamily, Commercial, Hard to Reach (HTR) customers, Disadvantaged Communities (DAC), Commercial, Industrial, Agricultural, Other

IMC

Project Submission

Program Alignment

- TPM priority
- Technology transfer & EE portfolio alignment

Benefits

- Utility company benefits
- Disadvantaged and hard-to-reach community benefits

Quality of Idea

- Scope & project clarity
- Market strategy
- Innovation
- Project readiness

Timeline & Cost

- Duration
- Budget

CaINEXT Project Submission Form

PROJECT DETAILS

11. Please provide a brief description of the proposed project that will serve as the public description of the project. *
 Make sure to describe the technology or technology deployment method being researched including what it does and why it is unique. This is a good place to include the research question/hypothesis. Your description must be 500 words or less and will be publicly displayed on the CaINEXT Website if your Project Plan is approved.

12. Is the solution/technology available in the market today? Which best describes the current state of the solution? Check all that apply. *

- It is commercially available
- It has finished conducting field demonstration(s)
- It has finished conducting lab demonstration(s)
- It has completed prototype development
- Not Sure

13. Please describe the target market sector applicable to this technology.
 For example, Residential, Multifamily, Commercial, Hard to Reach (HTR) customers, Disadvantaged Communities (DAC), Commercial, Industrial, Agricultural, Other

What is a Technology Campaign?

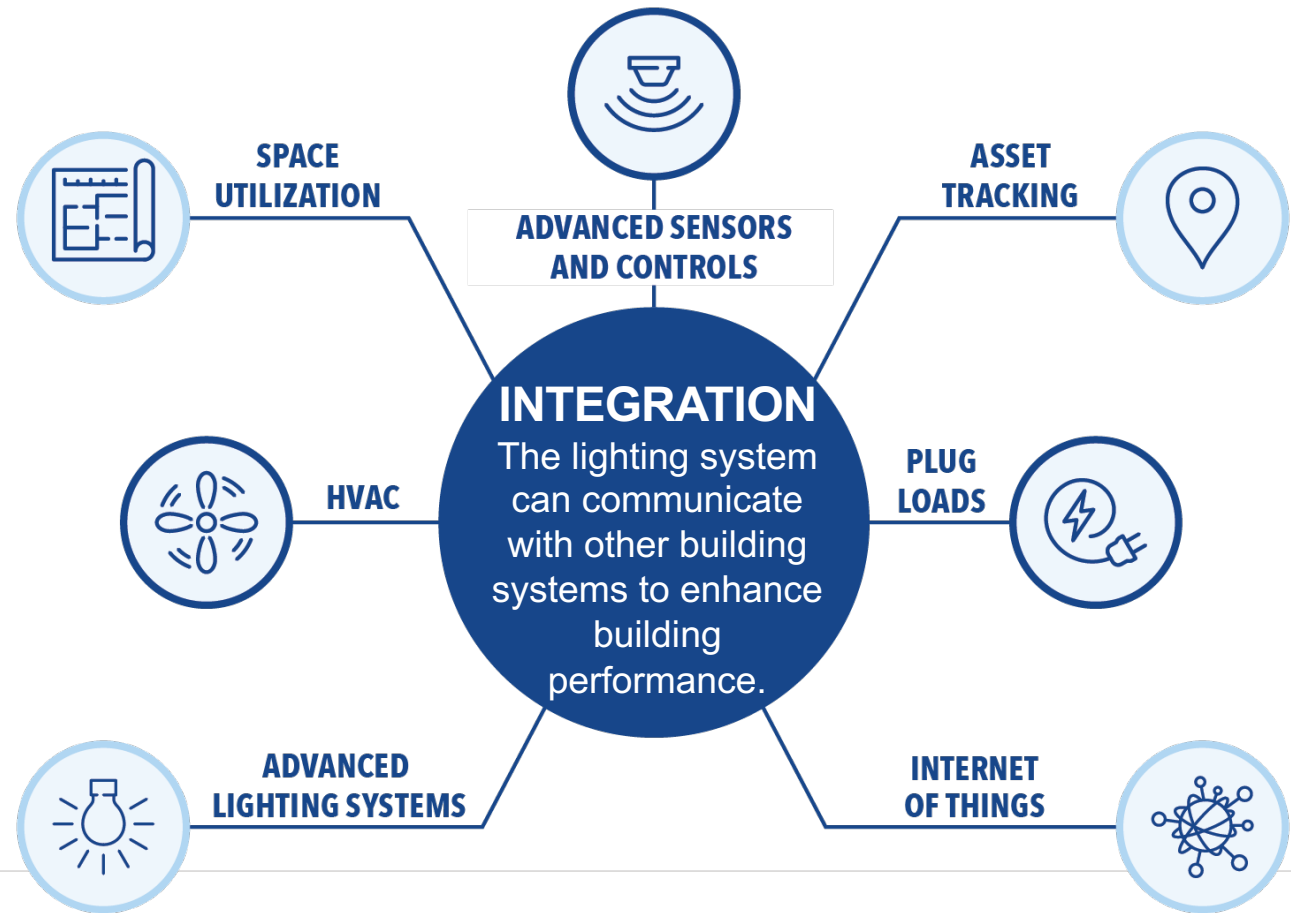

A collaborative platform to speed technology adoption

- The Campaign targets building owners and managers who are open to adopting advanced and novel approaches to improve building performance
- Demonstrate and recognize real-world savings and benefits
- Provide resources that make it easier for buyers to consider new or underutilized solutions
- Celebrate success!

Overview – Integrated Lighting Campaign

ILC recognizes innovative lighting projects and organizations that push the envelope in terms of integration, energy savings, novel capabilities, and non-energy benefits

Campaign Partners

Organizers

Industry Orgs, DOE, GSA

- Provide direction, guidance, and support
- Confirm recognitions
- Meet bi-weekly with ILC team

Supporters

Energy Efficiency Organizations,
Utilities, Manufacturers

- Promote ILC in their organizations and networks
- Provide products and services to Participants

Participants

Building owners and facility managers

- Adopt the technology
- Get recognized
- Work with ILC to promote their recognition

U.S. DEPARTMENT OF ENERGY

Healthcare Campus Recognized for Innovative Use of Lighting Sensors and Controls

CASE STUDY: BRYAN HEALTH

About the Project
Bryan Health is a locally owned, nonprofit healthcare organization serving patients in Nebraska, as well as parts of Kansas, Iowa, South Dakota, and other states in the region. When a scheduled remodel neared, Bryan Health saw an opportunity to upgrade lighting throughout its East and West Campus locations in Nebraska and replace all their fluorescent luminaires with energy-efficient LEDs. A new, modern lighting system held the promise of significantly reducing energy consumption, lowering operating costs, and streamlining maintenance. But what else could it do? It turns out, quite a lot.

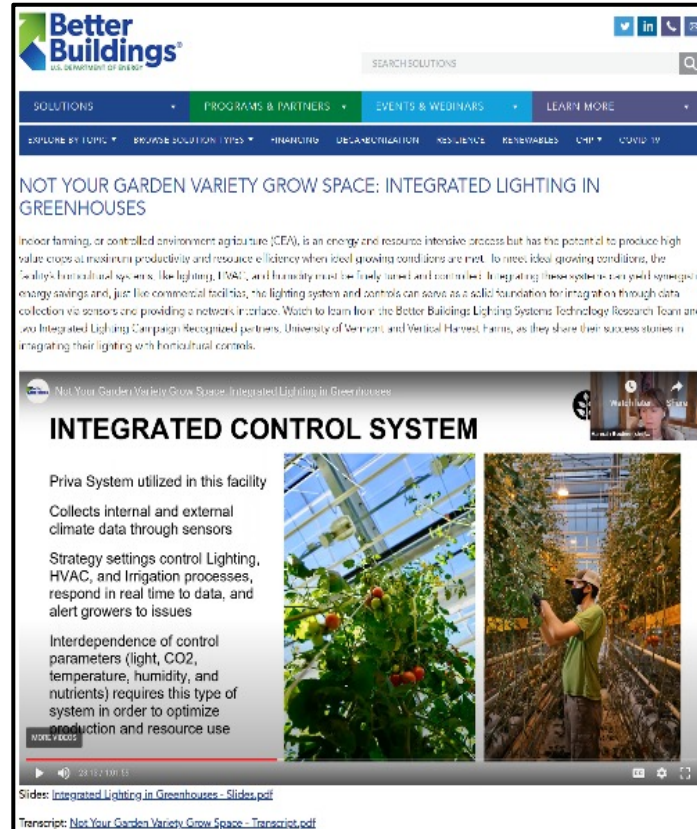

Mika Winath, master electrician at Bryan Health, explored lighting applications and integration strategies with internal stakeholders that could also support physician productivity and contribute to patient wellness and healing.

Project Goals

- **PERSONALIZATION.** Give office personnel and medical health providers ability to set their own task lighting scenes. Lighting control is particularly important for radiologists when taking x-rays and reviewing scans.
- **DIMMABILITY.** Lighting fixtures needed to be dimmable to benefit from daylight harvesting but also to reduce brightness of the LED lights to reduce glare.
- **EFFICIENCY.** They needed a lighting system that could streamline and automate certain tasks, reduce unnecessary energy consumption, and lower utility bills. As an added bonus, their utility, Lincoln Electric System, offered Bryan Health a rebate for each fluorescent lamp removed and a separate rebate to cover a percentage of labor costs for installing new controls.
- **CENTRALIZATION.** They also wanted to manage it all from an easy-to-use, cloud-based, centralized lighting system with advanced data visualization.

NOT YOUR GARDEN VARIETY GROW SPACE: INTEGRATED LIGHTING IN GREENHOUSES

Indoor farming, or controlled environment agriculture (CEA), is an energy- and resource-intensive process but has the potential to produce high value crops at maximum productivity and resource efficiency when ideal growing conditions are met. To meet ideal growing conditions, the facility's horizontal and spectral, like lighting, HVAC, and humidity must be finely tuned and controlled. Integrating these systems can yield synergistic energy savings and, just like commercial facilities, the lighting system and controls can serve as a solid foundation for integration through data collection via sensors and providing a network interface. Watch to learn from the Better Buildings Lighting Systems Technology Research Team and two Integrated Lighting Campaign-Recognized partners, University of Nevada and Vertical Harvest Farms, as they share their success stories in integrating their lighting with horticultural controls.

INTEGRATED CONTROL SYSTEM

Priva System utilized in this facility

- Collects internal and external climate data through sensors
- Strategy settings control Lighting, HVAC, and Irrigation processes, respond in real time to data, and alert growers to issues
- Interdependence of control parameters (light, CO2, temperature, humidity, and nutrients) requires this type of system in order to optimize production and resource use

Slides: [Integrated Lighting in Greenhouses - Slides.pdf](#)

Transcript: [Not Your Garden Variety Grow Space - Transcript.pdf](#)

Building a body of knowledge around advanced and integrated lighting serves as a valuable resource to other stakeholders that this technology is reliable, saves energy, reduces cost, and improves occupant experience

The Body of Knowledge

EFFICIENT AND HEALTHY SCHOOLS

Lighting Retrofits for Schools

Holt Public Schools: Recognized ILC Participant

- Project Stats:
 - 9 schools, 5,000 students
 - HS Campus: 340,000 ft²
 - 10,000+ LED Bulbs
 - 8,000+ Bluetooth occupancy sensing devices
 - 3,000+ Bluetooth devices in the Holt High School alone in a single fiscal year
- Benefits:
 - 50% energy savings over previous fluorescent system
 - Energy monitoring, allowed for regular utility rebates
 - Integration with the HVAC systems permits for 100%+ occupancy sensing, lighting, and air conditioning control platforms

Better Buildings

NOT YOUR GARDEN VARIETY GROW SPACE: INTEGRATED LIGHTING IN GREENHOUSES

INTEGRATED CONTROL SYSTEM

Project Goals:

- Integrated Controls for HVAC & Lighting Systems

Project Motivation:

- The project involved the control system, reducing the greenhouse's energy use by 20% and increasing the yield of the greenhouse by 10%.

Plug Load & Lighting System Integration:

- Each of the major plug loads at the greenhouse (light fixtures, fans, and other equipment) was connected to the control system.

Better Buildings

Integrated Controls for Plug Loads and Lighting Systems

Higher Education Buildings Recognized for Integrated Controls for HVAC and Lighting Systems

Project Goals:

- Future Proofing: The facilities team in California continues to take a long-term view of the building's energy use and is looking for ways to integrate smart technologies to reduce energy use and improve occupant comfort.
- Personalization: Each of the buildings has its own unique energy profile and is being designed to meet the needs of its specific users.

University of Minnesota:

- Energy Savings: The project has resulted in a 10% reduction in energy use and a 10% increase in occupant comfort.

8 Case Studies

2022 RECOGNIZED PARTICIPANT

CHICAGO SMART LIGHTING PROGRAM (CSLP)

Converted over 200,000 high-pressure sodium streetlights to high-efficiency LED street lighting.

Achieved \$3.7 Million (45%) in annual energy savings.

Resulted in improved and more responsive operation of urban infrastructure.

Technology Campaigns: Adapting Commercial Building Strategies to the Residential Sector

Philip Lane, Linda Bentley, Christian Vahary, Angela Brossman

Abstract

The Department of Energy (DOE) designed and delivered technology campaigns to the residential sector to advance technology adoption and energy efficiency. This paper reports on the findings and lessons learned from the Integrated Lighting Campaign (ILC) and Multiple Field Evaluations (MFEs).

Unconnected Lighting Systems in Smart Buildings: Findings and Lessons Learned from the U.S. Department of Energy Integrated Lighting Campaign and Multiple Field Evaluations

Michael Moore, Pacific Northwest National Laboratory
Philip Lane, Pacific Northwest National Laboratory
Linda Bentley, Pacific Northwest National Laboratory
Christian Vahary, U.S. Department of Energy

ABSTRACT

Commercial buildings are making great strides in transitioning to high efficiency lighting, with lighting systems (LIS) in the predominant type in commercial spaces. This paper provides a perspective of these findings in a year that saw over 20% of installed base (IB) in 2020. Although the energy savings from LIS are great, energy efficiency gains are being realized more slowly by adapting connected lighting systems (CLS) lighting systems. The energy savings potential of connected lighting systems (CLS) lighting systems, and the challenges associated with their deployment, are explored in this paper. Connected lighting systems (CLS) lighting systems account for only 7% of the ILC installed base (IB) in 2020. This paper provides a perspective of these findings and lessons learned from the ILC and MFEs. The opportunity exists for smart buildings to realize the full potential of their LIS. This paper provides a perspective of these findings and lessons learned from the ILC and MFEs. This paper will present the findings from projects that were completed in the Integrated Lighting Campaign for case study performance related to the connected use of systems and controls, as well as the integration of lighting systems with other building and business systems. Results related to building owners will be presented, along with best practices and lessons learned from the installation and operation of these systems.

Introduction

Light emitting diode (LED) have opened the lighting industry to less than 10 years and are expected to grow to market their, approaching saturation in most lighting applications by 2019 (DOE, 2019). LED adoption and use are projected through 2025, an estimated cumulative lighting energy savings of 67 quadrillion British thermal units (quads) of primary energy would be saved (DOE, 2019). Deployment of Energy (DOE) systems was intended to quantify savings in possible from the use of controls and connected systems (DOE, 2019). ILC would also not have been possible if not for the energy savings achieved in the Integrated Lighting Campaign and the technology change technologies, and this is before the inclusion of LIS systems and energy savings from other (i.e., non-lighting) buildings, in a typical US quads savings. This is just one example of the potential savings from lighting energy savings (DOE, 2019).

2 Journal Publications

6 Infographics

Technical Resources

The ILC offers resources ranging from fact sheets and case studies to recorded webinars and utility incentives

- These resources help facility owners and managers overcome barriers to adoption, like lack of education, complexity, and funding

Recognition

Group photo from the 2022 ILC Recognition Event, held at IES Annual Conference, in New Orleans, LA on August 20, 2022.

Recognition highlights and promotes early adopters as industry leaders. Sharing their stories lets other stakeholders know this technology saves energy, reduces costs, and improves buildings.

Recognition Promotion

2022 RECOGNIZED PARTICIPANT

CHICAGO SMART LIGHTING PROGRAM (CSLP)

Location:
Chicago, Illinois

Recognition Category:
Other Integrated Systems and Lighting

Building Type:
Street Lighting

Project Partners:

integratedlightingcampaign.energy.gov

Converted more than 280,000 high-pressure sodium streetlights to high-efficiency LEDs with smart Lighting Management System.

Considered one of the largest and most reliable Smart Technology Infrastructure systems in the country.

Achieved \$8.7 Million (46%) in annual energy savings.

The City of Chicago hired a diverse workforce for this project, including 27% Minority Business and 7% Women's Business Enterprise participation, and 10% workers from economically disadvantaged areas.

Resulted in improved and more responsive operations of lighting infrastructure.

In addition to monitoring outages, the lights can be turned on and off, dimmed, and monitored for ampacity, voltage, and wattage. This helps in troubleshooting outages and doing preventative maintenance.
